Game of Life

DiPS CodeJam 23

Prompt

Conway's Game of Life is a zero-player game defined as a grid of cells, each having a state that corresponds to either "dead" or "alive." The cells follow the following rules:

- Any live cell with two or three live neighbours survives.
- Any dead cell with three live neighbours becomes a live cell.
- All other live cells die in the next generation. Similarly, all other dead cells stay dead.

Your task, given a starting condition for the game, is to compute the next generation of cells and find how many cells are alive.

Input Format

- The first line contains an integer n, denoting the size of the grid.
- The next n line contain n space-separated values each, either 0 or 1.

Output Format

Your output must contain a single integer denoting how many cells are alive in the next generation.

Sample Input/Output

Input	Output
1 1 1 1 0 1 0 1 1 0 1 0 0 0 0 1 1 0 1 0 1 1 1 0 0 1 0 0 1 0 1 1 1 0 0 1 0 0 0 0 0 1 1 0 0 1 0 0 0 0 1 0 0 1 1 1 0 0 0 1 0 0 1 1	30

Sample Program

```
n=int(input())

grid=[]

for i in range(n):
  grid.append(list(map(int, input().strip().split())))
```

```
newGrid = grid.copy()

def safeCell(i, j):
  try:
    return grid[i][j]
  except:
    return 0

for i in range(n):
  for j in range(n):
    total = 0
    cells_to_check=[
      [i-1, j-1],
      [i-1, j],
      [i-1, j+1],
      [i, j-1],
      [i, j+1],
      [i+1, j-1],
      [i+1, j],
      [i+1, j+1],
    ]
    for cell in cells_to_check:
      total+=safeCell(cell[0], cell[1])

    if grid[i][j]  == 1:
      if (total < 2) or (total > 3):
        newGrid[i][j] = 0
    else:
      if total == 3:
        newGrid[i][j] = 1

print(sum([sum(i) for i in newGrid]))
```
